Chapter 1

Introduction

We develop an algorithm to compute Fourier expansions of Hermitian Modular Forms of degree 2 over $\mathrm{Sp}_2(\mathcal{O})$ for $\mathcal{O} \subseteq \mathbb{Q}(\sqrt{-\Delta})$, $\Delta \in \{3, 4, 8\}$.

In [PY07], spaces of Siegel Modular Cusp forms are calculated.

A similar algorithm is also [Rau12, Algorithm 4.3] for Jacobi forms.

We are doing the same for Hermitian Modular forms.

Chapter 2

Background results

2.1 Preliminaries

Let $\mathrm{M}_n(\mathbb{K})$ be the set of all $n \times n$ matrices over some field $\mathbb{K}$. Likewise, $\mathrm{M}_n^T(\mathbb{K})$ are the symetric $n \times n$ matrices. A matrix $Y \in \mathrm{M}_n(\mathbb{R})$ is greater 0 iff $\forall x \in \mathbb{R}^n - \{0\} : Y[x] := x^T Y x > 0$. Let $\mathbb{H}_n := \left\{ Z = X + iY \in \mathrm{M}_n^T(\mathbb{C}) \,\middle|\, Y > 0 \right\}$. Thus, $\mathbb{H}_1$ is the Poincaré upper half plane.

The general linear group is defined by $\mathrm{GL}_n(\mathbb{K}) = \{X \in \mathrm{M}_n(\mathbb{K}) \mid \det(X) \neq 0\}$ and the special linear group by $\mathrm{SL}_n(\mathbb{K}) = \{X \in \mathrm{M}_n(\mathbb{K}) \mid \det(X) = 1\}$. The orthogonal group is defined by $\mathrm{O}_n(\mathbb{K}) = \left\{ X \in \mathrm{GL}_n(\mathbb{K}) \,\middle|\, X^T 1_n X = 1_n \right\}$. The symplectic group is defined by $\mathrm{Sp}_n(\mathbb{K}) = \left\{ X \in \mathrm{GL}_{2n}(\mathbb{K}) \,\middle|\, X^T J_n X = J_n \right\}$ where $J_n := \left(\begin{smallmatrix} 0 & 1_n \\ -1_n & 0 \end{smallmatrix}\right) \in \mathrm{SL}_{2n}(\mathbb{K})$. $\mathrm{Sp}_n(\mathbb{K})$ will also be called the Hermitian modular group.

A **Siegel modular cusp form** of degree $n \in \mathbb{N}$ for some $\Gamma \subseteq \mathrm{Sp}_n(\mathbb{Z})$ is a holomorphic function

$$f \colon \mathbb{H}_n \to \mathbb{C}$$

with

(1) $f|_k y = f \ \ \forall\, y \in \Gamma$

(2) for $n = 1$: $f(Z) = O(1)$ for $Z \to i\infty$

where

$$\left(f|_k \begin{pmatrix} A & B \\ C & D \end{pmatrix} \right)(Z) = f((AZ + B)(CZ + D)^{-1}) \cdot \det(CZ + D)^{-k}$$

with $Z \in \mathbb{H}_n$, $\left(\begin{smallmatrix} A & B \\ C & D \end{smallmatrix}\right) \in \Gamma$.

A **Hermitian modular form** of degree $n \in \mathbb{N}$ is a holomorphic function

$$f \colon \mathbb{H}_n \to \mathbb{C}$$

with weight $k \in \mathbb{Z}$ for some $\Gamma \subseteq \mathrm{Sp}_n(\mathcal{O})$, $\mathcal{O} \subseteq \mathbb{Q}(\sqrt{-\Delta})$, $\Delta \in \mathbb{N}$, $\nu \colon \Gamma \to \mathbb{C}^\times$ is an abel character of $\mathrm{Sp}_n(\mathcal{O})$, with

(1) $f(M \cdot Z) = \nu(M) \det(CZ + D)^k f(Z), \quad M = \left(\begin{smallmatrix} * & * \\ C & D \end{smallmatrix}\right) \in \Gamma, Z \in \mathbb{H}_n,$

(2) for $n = 1$: f is holomorphic in all peaks.

$[\Gamma, k, \nu]$ denotes the vector space of such hermitian modular forms.

In this work, we will concentrate on Hermitian Modular forms of degree 2. We will start with $\Delta \in \{3, 4, 8\}$.

Note that if Δ is fundamental, we have

$$\mathcal{O} = \mathbb{Z} + \mathbb{Z}\frac{-\Delta + \sqrt{-\Delta}}{2},$$
$$\mathcal{O}^{\#} = \mathbb{Z}\frac{i}{\sqrt{-\Delta}} + \mathbb{Z}\frac{1 + \sqrt{-\Delta}}{2}.$$

From now on, we will always work with Hermitian modular forms of degree 2, i.e. we will always have $n = 2$, except if otherwise stated.

Chapter 3

Theory

Lemma 3.1. *Let* $f\colon \mathrm{M}_2(\mathbb{C}) \to \mathbb{C}$ *be a Hermitian Modular form of weight* k. *Then,* $f(S\tau)\colon \mathbb{H}_1 \subseteq \mathbb{C} \to \mathbb{C}$ *is an eliptic modular form of weight* $2k$ *for some matrix* $S \in \mathrm{M}_2(\mathbb{Z})$ *with* $\Gamma(S) \subseteq \mathrm{SL}_2(\mathbb{Z})$.

Lemma 3.2. *Prop 7.3. von Poor für herm Modulformen.* $\Gamma(\mathcal{L}) \supseteq \Gamma_0(l)$ *for* $l \in \mathbb{Z}^+, ls^{-1} \in \mathcal{P}_n(\mathcal{O})$.

Now we will formulate the main algorithm of our work.

Algorithm 3.3.

1. Select a set of matrices $\mathcal{S} \subseteq \mathrm{M}_2^T(\mathbb{Z})$ with $0 < S \in \mathcal{S}$. Make $\mathcal{S}$ big enough. Now, for some $S \in \mathcal{S}$:

2. Fix $B \in \mathbb{N}$ as a limit. Or select a precision

$$\mathcal{F} := \left\{ \begin{pmatrix} a & b \\ \bar{b} & c \end{pmatrix} \middle| \, 0 \leq ac < B, b \in \mathcal{O}^{\#} \right\} \subseteq \Lambda,$$

where

$$\Lambda := \left\{ 0 \leq \begin{pmatrix} a & b \\ \bar{b} & c \end{pmatrix} \in \mathrm{M}_2(\mathcal{O}^{\#}) \middle| \, a, c \in \mathbb{Z} \right\}.$$

3.

$$\mathcal{M}^H_{k,\mathcal{S},\mathcal{F}} = \left\{ f[S] \,\middle|\, f \in \mathbb{Q}^{\mathcal{F}} \right\},$$

$$\mathcal{M}_{k,S} = \mathcal{F}\mathcal{E}_{\mathcal{F}(S)}(\mathrm{M}_k(\Gamma(S)))$$

4. If

$$\dim \mathcal{M}^H_{k,\mathcal{S},\mathcal{F}} \cap \bigoplus_{S \in \mathcal{S}} \mathcal{M}_{k,S} = \dim M^H_k,$$

then we are ready and we can reconstruct the Fourier expansion in the following way:

...

Chapter 4

Implementation

In this chapter, we are describing the implementation.

Chapter 5

Conclusion

Blub

Chapter 6
